- Results

Introduction

Kaniv Reservoir

[49°55'34"N 31°28'46"E](#)

Type: hydroelectric reservoir
Primary inflows: Dnieper River
Primary outflows: Dnieper River
Basin countries: Ukraine, Belarus, Russia

Normal water level: since 1976
Length: 123 km
Max. width: 8 km
Surface area: 675 km²
Average depth: 4 m
Surface elevation: 87 m

Objectives

The study contributes to the Kaniv Reservoir research works and uses satellite data **to explore urban land cover changes** in the coastal zone of the Kaniv Reservoir throughout a **35-year** study period:

1/ to detect and quantify urban land cover changes using satellite Landsat data,

2/ to analyze land surface temperature (LST) trend in the coast zone of the reservoir within different study area zones.

Data and Methods

FRWL = 92.7 m
(Forced Retaining Water Level)

5550000N

Conditional zones for analysis

N	Description	% of water
1	Intensive construction and expansion of infrastructure	25
2	long-term disturbed soil and vegetation cover	50
3	plain intensive agriculture area	-

● Location of meteorological stations Kiev and Kaniv

Data and Methods

Satellite Landsat imagery

Data	Date	Processing level	Source
Landsat-5	6.06.1985	Surface reflectance, L2A	https://earthexplorer.usgs.gov/
Landsat-7	7.06.2000		
Landsat-9	20.06.2022		

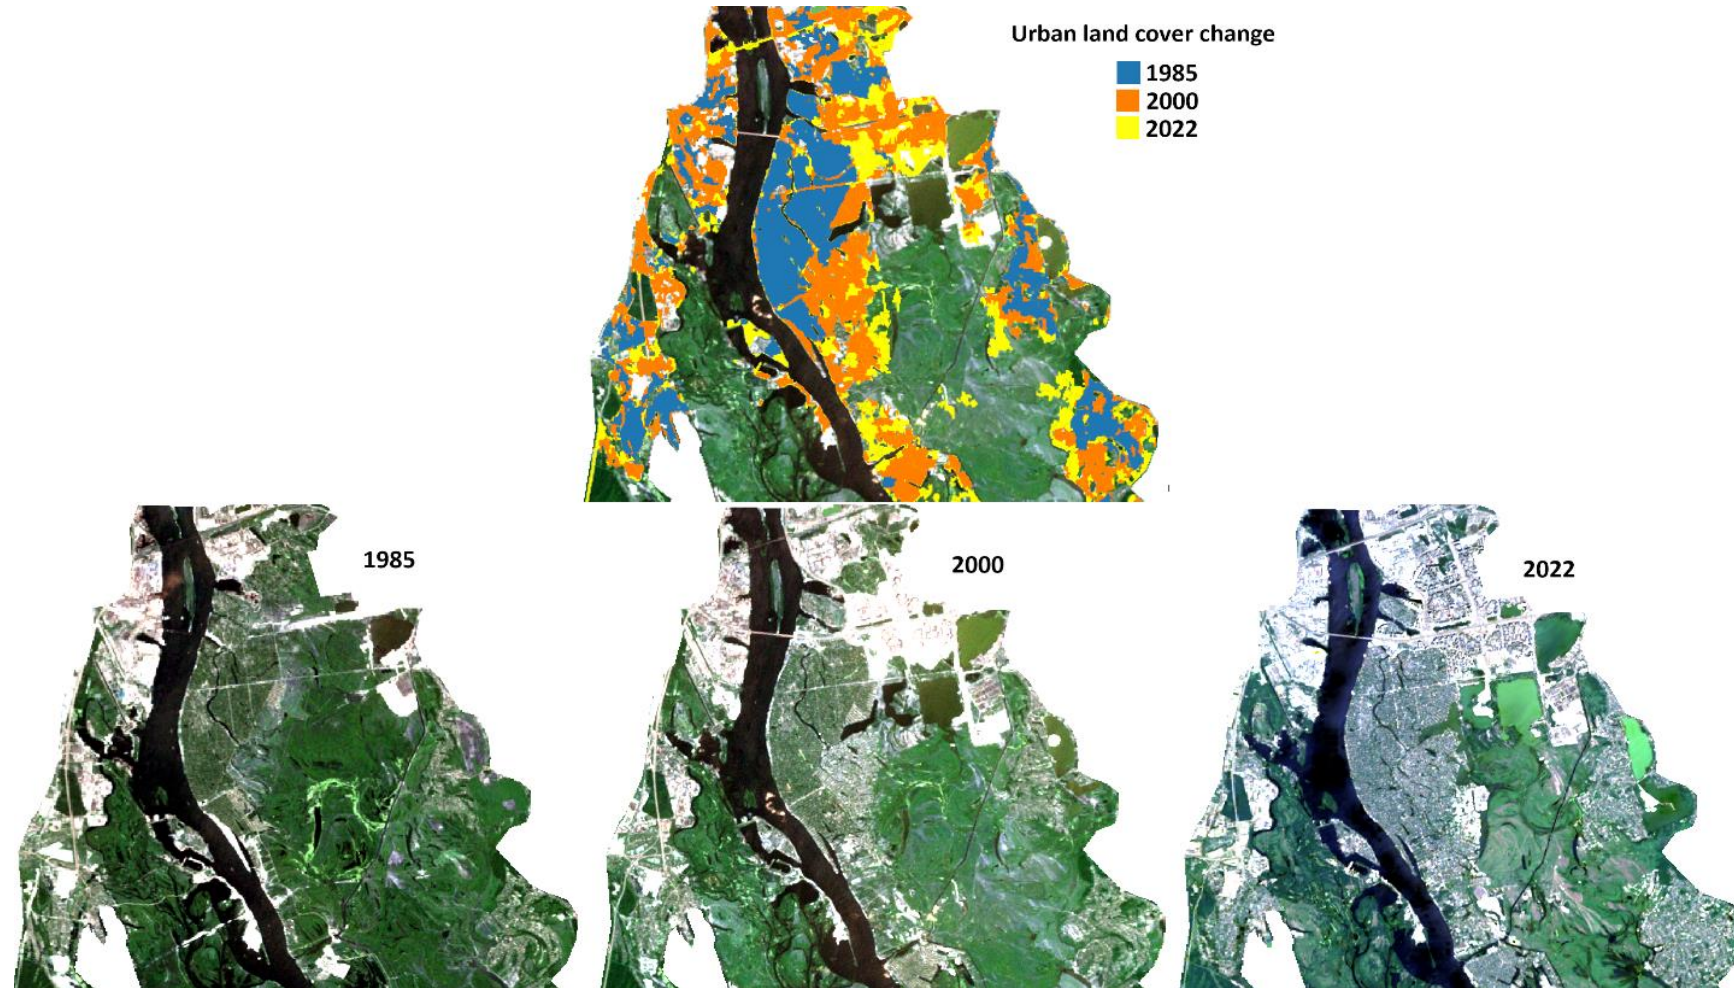

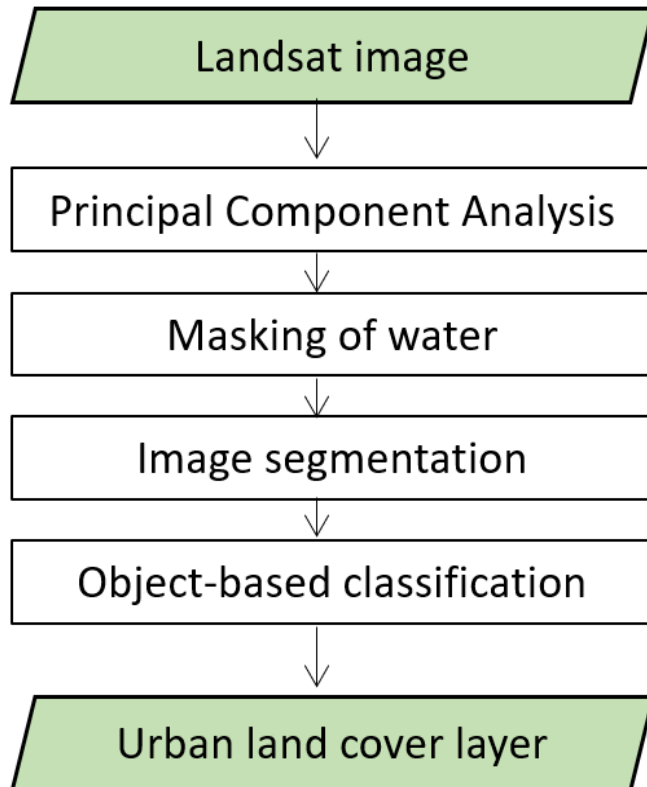

Average day air temperature May – September 1985 - 2022

● Location of meteorological stations Kiev and Kaniv

Processing of satellite Landsat data

Changes of urban land cover in zones 1, 2, 3 of study area in 1985, 2000, and 2022

Analysis of Land Surface Temperature (LST)

- LST values were estimated using the Statistical Mono-Window algorithm (GEE code from Ermida et al. 2020)
- LST values were estimated for 3 zones and 6 small locations from zone 1
- LST values were estimated for vegetation period from May to September for the period of 35 years

Ermida, S., Soares, P., Mantas, V., Göttsche, F.-M., Trigo, I. 2020. Google Earth Engine Open-Source Code for Land Surface Temperature Estimation from the Landsat Series. Remote Sensing. 12. 1471. 10.3390/rs12091471.

Conclusion

- The urban land cover has been increasing during the analyzed time period from 1985 to 2022
- The increase was uneven over time and different in each of three zones. Zone 1, which is closest to Kiev city, saw the maximum increase in urban area, with a growth rate of 3.6 times.
- There is a positive trend in surface temperature of 3 zones and 6 small locations throughout the entire study period (1985 - 2022).
- There is a statistical significant trend in surface temperature in August and September throughout the entire study period (1985 - 2022). The increase in surface temperature in August and September was approximately twice as higher as in other months.
